5G base station and substation integration

Overview

Does a 5G BS cluster integrate with EDGE data services?

The integration of 5G base station (5G BS) clusters and edge data services introduces novel digital loads (NDLs) into the distribution system (DS), significantly impacting the interactive coordination of 5G-DS. This paper proposes an expansion planning model of 5G and DS considering source-network-load-storage coordination.

What is the expansion planning model of 5G and DS?

An expansion planning model of 5G and DS considering source-network-load-storage coordination is proposed. NDLs from 5G BS clusters and EDCs are introduced to accommodate the RESs. Dynamic access services of 5G BS clusters are formulated to leverage their flexibility.

Are 5G BS clusters able to accommodate Res?

The coordination capability between 5G BS clusters and DS is constrained, hindering their potential to accommodate RESs. 4.3. Analysis of edge data center operation Fig. 11 shows the service status of EDCs for 5G BS clusters. In the figure, the pink and green areas correspond to the processing number of IWs and BWs received by the EDC.

Can 5G BS clusters and EDC data processing improve DS operation?

The proposed model fully captures the potential flexibility of 5G BS clusters and EDC data processing, which can be leveraged with source-network-load-storage elements to achieve cost-effective DS operation. MILP relaxation is then developed to facilitate the computational solution.
