## Overview

---

Are energy storage systems suitable for frequency modulation?

Energy storage systems, characterized by their flexible charging and discharging capabilities and rapid response times (Zhong et al., 2006), are also well-suited for frequency modulation tasks.

Can photovoltaic power stations be controlled by a joint frequency modulation optimization?

The result of this project can also be extended and applied to the primary frequency control of grid-connected photovoltaic power stations in the power grid, and even further applied to the joint frequency modulation optimization control of the multi-energy complementary interconnected power system of the power grid.

Do photovoltaic power stations participate in primary frequency modulation?

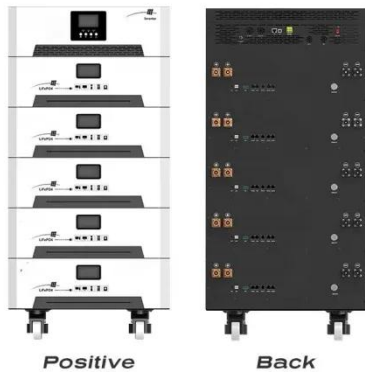

In addition, comparing the bid capacity of the frequency modulation market before and after introducing energy storage reveals that due to the increase in the output of photovoltaic power stations at noon, a higher proportion of photovoltaic power stations participate in primary frequency modulation at this time compared to wind farms.

Should thermal power units be used in frequency modulation?

Nevertheless, the current market design, which relies heavily on the dominant role of thermal power units in frequency modulation, fails to capitalize on the unique attributes of renewable energy and energy storage systems (Liao and Dai, 2005). Consequently, there is an imperative need to reevaluate the market mechanisms.
