# Battery energy storage peak load protection

## Overview

---

How to reduce peak load in energy storage systems?

By operating these storage systems using the coordinated control strategy, the maximum peak load can be reduced by 44.9%. The rise in peak load reduction increases linearly with small storage capacities, whereas saturation behavior can be observed above 800 kWh. Linear programming optimization tool for energy storage systems.

Can coupled storage systems reduce peak load?

The case study involves three charging parks with various sizes of coupled storage systems in a test grid in order to apply the developed method. By operating these storage systems using the coordinated control strategy, the maximum peak load can be reduced by 44.9%.

How do battery energy storage systems work?

Graphical overview of the paper. Several battery energy storage systems (BESSs), modeled in detail as shown in the blow-up, located at three different charging parks, are able to communicate with each other. They are coordinated and controlled by a central control unit to reduce the peak power at the point of common coupling (PCC).

What is load PCC?

The load at the PCC is displayed both with ( Load PCC,with CP) and without ( Load PCC,wo CP) charging parks. The battery energy storage systems (BESSs) operate in stand alone mode in accordance with state-of-the-art peak shaving and the resulting power flow is showed as a filled area ( Load PCC,PS).
