How long do batteries last if not used?

Most unused alkaline batteries will last between five and 10 years, while Ni-MH batteries have a shelf life of three to five years of non-use. Most expiration dates are conservative so most likely your expired batteries will still have a charge for some time after, if they are stored in optimal conditions. Do batteries run out when not used?

.

What happens if a battery expires?

In addition to the decline in performance, expired batteries may also pose safety risks. The chemical substances inside the batteries can become unstable over time, which may lead to leakage or, in some cases, the batteries may overheat or even explode.

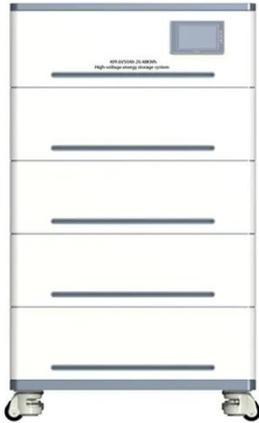

Do batteries have a shelf life?

The answer is yes. Batteries have a limited shelf life, which means that over time, even when not in use, they will gradually lose their ability to store electrical energy. The shelf life of batteries is influenced by a variety of factors, one of the most important being storage conditions.

Do alkaline batteries expire?

Your standard alkaline AA, AAA, C, D and 9 V batteries have a shelf life of about five to ten years, which is really long. But those batteries definitely expire: after so many years, the unavoidable 2-3 % per year self-discharge inevitably leads to a dead alkaline battery. The thing is, you cannot recharge them.
