# Container ship power generation system

## Overview

---

What is shipboard electrical power generation?

Shipboard electrical power generation is generally for ship service power supported by emergency generators. In the case of a prime mover-driven propulsion system, ship service electric power is generated by ship service generators. This chapter summarizes US and IEC shipboard power generation and distribution levels at 50 HZ and 60 HZ.

What is a ship service generator?

Ship service generator size, rating, and quantity requirements are very well defined by IEEE 45, American Bureau of Shipping (ABS), and USCG with some slight differences. Abstract Shipboard electrical power generation is generally for ship service power supported by emergency generators.

What is a solar powered ship?

Solar/battery powered ships Solar/battery power system is the typical power system configuration for medium and small-scale solar-powered ships. The "Sun 21" (Fig. 9 a) was the world's first solar-powered ship to cross the Atlantic in 2006, with 65 m<sup>2</sup> PV panels between the hull to supply the ship power system .

How much power does a container ship use?

The ship can load 1200 FEU (forty-foot equivalent unit) refrigerated containers and consumes approximately 7440 kW of power when operated at the maximum load. Figure 1 shows the power system of the target ship, and Table 1 lists the specifications of the ship. Figure 1. Power system of the target container ship. Table 1.
