## Overview

Does lead-acid battery technology reduce cost?

Lead-acid batteries are a mature technology, especially in the context of starting lighting ignition batteries used in automobiles. Hence, a 15 percent cost reduction is assumed as this technology gains penetration in the energy storage space. Cost decreases are shown in Table 5. Table 5. Cost Decrease from 2018 to 2025 by Battery Technology.

What is the LCoS value of a lead-acid battery?

These values are followed by gravitational, thermal, Li-ion LFP, vanadium RFB, and Li-ion NMC which fall in a tight range of \$0.13-\$0.20/kWh. Lead-acid at \$0.33/kWh and hydrogen (\$0.35) have high LCOS due to low cycle life of lead-acid batteries and low RTE and high fuel cell and electrolyzer stack costs for hydrogen. Figure 6.2.

Are lithium-based solutions cheaper than lead-acid solutions?

In summary, the total cost of ownership per usable kWh is about 2.8 times cheaper for a lithium-based solution than for a lead acid solution. We note that despite the higher facial cost of Lithium technology, the cost per stored and supplied kWh remains much lower than for Lead-Acid technology.

Why is a lead-acid system better than a lithium-ion system?

Typically, the lead-acid system has low cost over other systems, but also lower calendar and cycle lives especially at high DoD in comparison to the prevalent lithium-ion technology, as well as a low energy density, which makes it less competitive as a product.
