Does the power supply for new 5G base stations need to be expanded

Overview

Why are small cells a new part of 5G?

The need to increase the number of base stations to provide wider and more dense coverage has led to the creation of small cells. Small cells are a new part of the 5G platform that increase network capacity and speed, while also having a lower deployment cost than macrocells.

Will 5G use micro-cells?

Therefore, in 5G networks, high-frequency resources will no longer use macro base stations, micro-cells become the mainstream, and the small base stations will be used as the basic unit for ultra-intensive networking, that is, small base stations dense deployment.

What is the work difficulty of 5G network & powering solution?

work difficulty. 1) 5G Network general descriptions, cells 2) Powering solution divided into local powering, remote coverage, and impact on powering strategy, powering and share infrastructures in three different type of 5G network and feeding solutions cases and there will be very technical specifications.

What is the coverage area of 5G high-frequency base stations?

The radius of coverage area of 5G high-frequency base stations will be less than one-tenth of that of 4G base stations, and the coverage area of 5G high-frequency base stations will be less than one percent of that of 4G base stations. The deployment of macro base stations is difficult and the site resources are not easy to obtain.

5G infrastructure power supply design ...

Discover the factors that telecoms organizations need to consider for 5G infrastructure power design in the network core and cloud.

- LiFePO₄ Battery, safety
- Wide temperature: -20~55°C
- Modular design, easy to expand
- The heating function is optional
- Intelligent BMS
- Cycle Life: > 6000
- Warranty: 10 years
