Energy storage power supply hardware configuration

Overview

How to optimize energy storage system configuration results?

Optimized configuration results. Due to the influence of factors such as the rated capacity, rated charge and discharge power and output of the energy storage system, the change trend of the user's net revenue with the capacity and power of the energy storage system should be a three-dimensional surface on the basis of optimizing the output.

How much power does an energy storage system have?

When the minimum requirement for renewable energy accommodation rate is raised to 85%, the energy storage system configuration results in a capacity of 360.77 kWh and a power of 142.17 kW. Similarly, when the indicator is raised to 90%, the energy storage system configuration results in a capacity of 424.45 kWh and a power of 231.19 kW.

Does a high reliability power supply transaction model improve energy storage capacity?

After considering the high reliability power supply transaction model, Method 2 proposed in this paper increases the capacity of the energy storage system to 44MWh, improving the endurance of the user-side energy storage system for supplying power to loads, and ensuring the supply of more loads in the same time.

Does the user-side energy storage system participate in a high reliability power supply transaction?

According to the above analysis, in order to fill the research gap of the user-side energy storage system participating in the high reliability power supply transaction, this paper first proposes a high reliability power supply transaction model between the user-side energy storage system and the power grid company.
