# Fire protection system for wind power plants

## Overview

---

Do wind turbines need fire protection?

Some fire protection systems are recommended for wind turbines, but each case must follow even more specific safety recommendations. The systems mentioned in NFPA 850 include gas systems, water mist, compressed air foams, and aerosols.

How to prevent fire at wind turbines?

5.2.1 Fire detection In order to effectively limit fire and consequential loss, fires at wind turbines shall also be detected early on by automatic fire detection systems, in particular, since wind turbines are usually operated without any on-site staff. Distinction is basically made between room and installation monitoring.

What are the objectives of a wind turbine fire prevention program?

The objective is to minimize the incidence rate and the scope of a potential loss by fire at wind turbines. In addition to special fire protection measures for detecting, fighting and preventing fires, procedural safety measures and comprehensive control technologies/systems for monitoring procedural operations and conditions are required.

Should wind farms retrofit fire suppression systems?

As wind farms prep for eventual replacements, retrofitting fire suppression systems remains a viable interim opportunity to both safeguard existing turbines and increase the ability of operators to coordinate fire protection across their facility's footprint, which typically extends over thousands of acres.
