# **Flat roof solar panels and sloping roof solar panels**

## Overview

---

Should solar panels be installed flat or sloped?

In fact, flat roof installations often outperform sloped roof systems when properly designed and installed. The key is understanding that panels should never be installed completely flat against the roof surface. Solar panels require a minimum tilt angle of 10 degrees to function optimally and maintain manufacturer warranties.

What is a flat roof solar installation?

Flat roof solar installation offers unique advantages that many homeowners and businesses overlook. While sloped roofs dominate the residential solar market, flat roofs provide exceptional flexibility for optimal panel positioning, easier maintenance access, and often superior energy production potential.

Do solar panels work on a flat roof?

Many homeowners assume solar panels only work on sloped roofs, but that's a common solar myth. In fact, flat roof homes can be well-suited for solar, with benefits like flexible panel placement, easier access, and a low-profile look. With the right installer and mounting system, a flat roof can support a high-performing solar setup.

How does a flat roof solar system work?

Instead, flat roof systems often use a weighted mounting system called a "ballast system," which uses gravity to keep your equipment in place. Solar panel systems on flat roofs often perform better than those on sloped roofs, resulting in better long-term savings.
