Flow battery discharge

Overview

For charging and discharging, these are pumped through reaction cells, so-called stacks, where H^+ ions pass through a selective membrane from one side to the other, while, in the external circuit, electrons travel in the same direction, inducing a current. How long does a flow battery last?

Flow batteries can release energy continuously at a high rate of discharge for up to 10 h. Three different electrolytes form the basis of existing designs of flow batteries currently in demonstration or in large-scale project development.

How do flow batteries work?

Charging and discharging are realized by means of a reversible electrochemical reaction between two liquid electrolyte reservoirs. Flow batteries are often called redox flow batteries, based on the redox (reduction-oxidation) reaction between the two electrolytes in the system. Fig. 9. Flow battery system .

What determines the energy storage capacity of a flow battery?

Volume of electrolyte in external tanks determines energy storage capacity
Flow batteries can be tailored for an particular application
Very fast response times- < 1 msec
Time to switch between full-power charge and full-power discharge
Typically limited by controls and power electronics
Potentially very long discharge times.

Can a flow battery be discharged without damaging the cell structure?

In flow batteries, high depth of discharge is possible which means most of its nominal capacity can be discharged without imposing any permanent damage to the cell structure 22. In addition, they can store electroactive materials required for battery operation in a tank outside the battery structure.
