Fuel cells as energy storage power station

Overview

Can fuel cell systems be used in stationary applications?

Within these projects, related to fuel cell systems applied to stationary applications, different configurations and end-user applications have been tested, namely as “back-up power supplies, power generation for remote locations, stand-alone power stations for one or more consumers, distributed generation for buildings and cogeneration” .

Which sectors use stationary fuel cells?

The main sectors where stationary fuel cells have been employed are (a) micro-CHP, (b) large stationary applications, (c) uninterruptible power supply (UPS), and integrated power supply (IPS). The fuel cell size for stationary applications is strongly related to the power needed from the load.

What is a stationary fuel cell?

The always-on nature of fuel cells provides reliability and can be used to fill intermittency gaps. For example, stationary fuel cells can be co-located with resources such as wind turbines, solar panels, or batteries at discrete customer sites, like retail stores or corporate campuses. Backup Power.

What is a fuel cell & how does it work?

Fuel Cells for Stationary Power Applications Fuel cells generate electricity through a mechanism that doesn't require combustion. This means they produce fewer pollutants than conventional, combustion-based power generation technologies. Fuel cells are also highly efficient, producing more power per unit of fuel.
