How big a capacitor should a 5g base station use

Overview

Are Murata capacitors suitable for 5G applications?

To help meet the demands of 5G applications, Murata offers a range high-Q, high temperature capacitors in small package sizes. Murata has a range of large capacitance/125°C suitable for applications requiring a high-temperature warranty.

Should a 5G base station be able to withstand a hot climate?

Both the 5G cells and the base station should remain functional even when subjected to severely wet and humid conditions. Even in extremely hot climates, 5G components must remain reliable, stable and energy efficient to prevent downtime, malfunctions and reduction in lifespan.

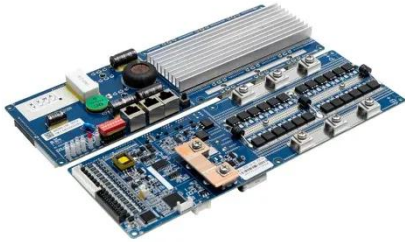

How can a 5G base station be truly global?

To develop truly global 5G coverage, base stations will need to be installed across the world in some extremely inhospitable environments. This means that the new generation of base stations needs to be designed with environmental challenges and extreme weather in mind, such as the effects of humidity, heat and wind.

What frequency bands will 5G support?

5G is targeting two frequency bands: sub-6 GHz and mmWave and it is expected that sub-6 GHz bands will be the backbone 5G infrastructure. For the mmWave and sub-6 GHz range with channel bandwidths of up to 100 MHz, components designed to support 4G infrastructure will be placed under higher demands.
