How big a pull-down resistor should I use for a 12v inverter

Overview

What should I consider when selecting pull up and pull down resistor values?

When selecting pull up or pull down resistor values, consider: Follow these guidelines for optimal pull up and pull down resistor design: When working with Arduino, pull up and pull down resistors are commonly used in: Common pull up and pull down resistor values for different applications:.

What are pull up and pull down resistors?

Pull-up and pull-down resistors are essential components in digital circuits that establish a defined logic state (high or low) when the input is in a high-impedance state. The main difference between pull up and pull down resistor is their connection and default logic state:.

When do you need a pull-up resistor?

You need to use a pull-up resistor when you have a low default impedance state and wish to pull the signal to 'high'. In the figure above, a pull-up resistor with a fixed value was used to connect the voltage supply and a particular pin in the digital logic circuit.

How do I wire a pull-up or pull-down resistor?

The figure below shows the correct way to wire a Pull-Up or Pull-Down Resistor for an active Device or Sensor with an output signal. In general, the pull-up or pull-down resistor should have a larger resistance than the logic circuit's impedance. A good rule of thumb is that you want a resistor value on the order of 10kΩ or higher.
