# How far is the Norwegian power plant s off-grid energy storage cabinet

## Overview

How do power plants in Norway work?

Many power plants in Norway have storage reservoirs and production can therefore be adjusted within the constraints set by the licence and the watercourse itself. Wind and solar power are intermittent; electricity can only be generated when the energy is available. The same applies to run-of-river power plants and small-scale hydropower plants.

How much power does Norway produce a year?

In a normal year, Norwegian power plants produce about 156 TWh (source: Electricity production - Norwegian Energy). The power production per year fluctuates depending on water inflow to the reservoirs. Still, hydropower is the only form of renewable energy production that can be adjusted based on demand.

How does the Norwegian electricity grid work?

As set out in 4.1 Constructing and Operating Transmission Lines and Associated Facilities, the Norwegian electricity grid system is structured into three levels. The principal laws that govern the construction and operation of electric distribution facilities are the Energy Act and the regulations derived from it, namely the Energy Act Regulation.

Does Norway have hydropower?

Hydropower accounts for most of the Norwegian power supply, and the resource base for production depends on the precipitation in a given year. This is a significant difference compared to the rest of Europe where security of supply is mainly secured through thermal power plants, with fuels available in the energy markets.
