# How to build a lead-acid battery for a self-built solar container communication station

## Overview

---

What is a lead acid battery container?

The container is a fundamental part of the lead acid battery's construction. There are, in general, two methods of producing the active materials of the cell and attaching them to lead plates. These are known after the names of their inventors. Plante plates or formed lead acid battery plates. Faure plates or pasted lead acid battery plates.

How to build a lead acid battery at home?

You must work in ventilated space to disperse fumes when you build this simple lead acid battery at home. Put on your plastic gloves and face protection first. Then attach two suitable size lead sheets to the inside of one of the plastic containers. Those sheets should be a  $\frac{1}{2}$  inch above the base, and extend above the rim to attach crocodile clips.

How a lead acid battery is formed?

Plante plates or formed lead acid battery plates. Faure plates or pasted lead acid battery plates. In this process two sheets of lead are taken and immersed in dilute  $H_2SO_4$ . When an current is passed into this lead acid cell from an external supply, then due to electrolysis, hydrogen and oxygen are evolved.

What materials are used to make a lead acid battery?

The glass, lead lined wood, ebonite, hard rubber or bituminous compound, ceramic materials and molded plastics are having the above mentioned properties, hence the container of lead acid battery is made of either of those materials. The container is tightly sealed with top cover.
