Inverter power keeps changing

Overview

Do inverters have problems?

Inverters are very useful devices that help us keep our homes and offices powered during electricity outages. They convert DC power from batteries into AC power that can run our appliances. But like any machine, inverters can sometimes have problems. This article will explain 15 common inverter problems and how to fix them.

Why do inverters tripping?

Before we dive into the reasons, let's understand what tripping means. Inverters convert DC power (usually from batteries or solar panels) to AC power (what your home uses). When something goes wrong—like a power overload or wiring problem—the inverter turns off or "trips" to protect itself and your appliances. Think of it like a safety switch.

Why does a power inverter turn off?

When something goes wrong—like a power overload or wiring problem—the inverter turns off or "trips" to protect itself and your appliances. Think of it like a safety switch. If too many devices are running at once, or there's a fault in the system, the inverter shuts down. This helps avoid damage to the inverter and your electrical items.

What happens if a solar inverter goes out?

Your solar system – including the inverter – is connected to the power grid. If it continues to run during a power outage, it will supply electricity to the power lines and put the lives of technicians at risk. For this reason inverter systems have an automatic shutdown feature.
