Inverter s power frequency arm and high frequency arm

Overview

What is the topology of HFAC inverter bridge arm?

A new topology of the high frequency alternating current (HFAC) inverter bridge arm is proposed which comprises a coupled inductor, a switching device and an active clamp circuit. Based on it, new single-phase and three-phase inverters are proposed and their operating states are analysed along with the traditional H-bridge inverter.

How is PWM modulation determined in a high power inverter?

In high-power inverters, PWM modulation is determined based on the switching frequency. Essential Switching Frequency (ESF) methods and High Switching Frequency (HSF) methods are among the modulation techniques used in controlling these converters.

How effective is a coupled inductor bridge arm?

A coupled inductor bridge arm is integrated in them to achieve soft switching, electrical isolation, and structural flexibility. Their effectiveness is validated by experimental tests on a 400-W prototype. The traditional H-bridge inverter arm can generate outputs of 0 and $\pm V_{in}$ between the central node, as in Fig. 2a.

Why are coupled inductors used in HFAC power converters?

In the front-end converter, coupled inductors are widely used to achieve high step-up DC-DC conversion, which is particularly important for photovoltaic (PV) [17] and fuel cell applications [18]. The same concept can be applied to the HFAC power converter systems.
