Microgrid equipped with new energy storage power station

Overview

Due to the characteristics of integrated generation, load, and storage, mutual complementarity of supply and demand, and flexible dispatch, the photovoltaic-energy storage-charging (PV-ESS-EV) integrated station microgrid (ISM) mode, incorporating "PV- PV-ESS-EV + intelligent building" features, has become a focal point for energy conservation, carbon reduction, and energy transition in China. Why is multi-energy microgrid integration important?

With the increasing integration of multi-energy microgrid (MEM) and shared energy storage station (SESS), the coordinated operation between MEM and energy storage systems becomes critical. To solve the problems of high operating costs in independent configuration of microgrid and high influence of renewable energy output uncertainty.

Why is energy storage important in a microgrid?

Optimizing the configuration and scheduling of grid-forming energy storage is critical to ensure the stable and efficient operation of the microgrid. Therefore, this paper incorporates both the construction and operational costs of energy storage into the objective function.

What is a multi-energy microgrid system with shared energy storage station?

A multi-energy microgrid system with shared energy storage station is constructed. A multi-stage robust optimal scheduling model is proposed. The column and constraint generation algorithm with an alternating iteration strategy is proposed.

Can wt & PV be integrated into a microgrid?

Currently, WT and PV are often integrated into microgrids in a grid-following mode to inject power into the system. Energy storage devices, with their fast response times and high energy density, can provide flexible power dispatch capability to the microgrid when there is an imbalance between renewable energy and load .
