# Microgrids and Uninterruptible Power Supplies

## Overview

---

What is uninterruptible power supply (UPS) system?

Uninterruptible power supply (UPS) system is an important application of ESS in a microgrid.

What is a microgrid system?

A microgrid is a system composed of distributed generations, energy storage systems, power electronic converters, loads, and energy management systems [1,2]. Due to the advantages of simple structure, flexible control strategies, simple energy conversion, and high efficiency [3,4].

What is dc microgrid?

Some of the renewable energy sources such as solar and fuel cells produce DC power which is suitable for most of the existing equipment and devices such as computers, phones, LED lamps, and even electric vehicles work on DC power, DC microgrid presents itself as a more feasible alternative over AC microgrid.

What are the research interests of a microgrid engineer?

His research interests include AC, DC microgrids, microgrid clusters, modular power inverters for uninterruptible power systems, photovoltaic generation systems, paralleling power converters for renewable generation systems, power quality, as well as the applications of distributed control.
