Naypyidaw Communication BESS Power Station Model

Overview

What is a Bess control system?

A control system for the multifunctional applications of a battery energy storage system (BESS) proposed. Determination of the battery parameters for the BESS model. Design of appropriate controllers for the BESS control system. Requirements for the implementation of the proposed control strategy in DIgSILENT Power Factory environment.

How much power does a Bess draw from the grid?

It could be noted that at the instant of the power system frequency event, the BESS goes into the charging mode, thus drawing about 15.29MW active power from the grid (see Fig. 25). This helped in keeping the system frequency at about 50.24Hz. However, without the BESS providing the required support, the system frequency rose to 50.38Hz.

Does Bess provide reactive power support for a modified 12-bus test system?

Finally, the proposed control strategy for multifunctional applications of BESS, enabled it to provide reactive power support of 3.63Mvar for the modified 12-bus test system. Thereby, improving the voltage profile of the test system and consequently the quality of electric power supplied.

What is Li-ion Bess active power control in MV?

Li-ion BESS active power control in the MV the distribution system is shown in Equation (7), which is primarily designed to P_{chg} , when the wind power generation exceeds load demand and P_{dis} during higher demand than its wind power production, which is controlled by the battery's SoC within their threshold SoC_{min} and SoC_{max} .
