

**BLINK SOLAR**

# **Nickel-cadmium battery combined container base station**

## Overview

---

What is a nickel cadmium battery?

Nickel cadmium (NiCd) batteries are electrochemical devices that consist of a cadmium hydroxide negative anode and a nickel hydroxide positive cathode, capable of operating well at low temperatures, with a higher energy density and lifespan compared to lead acid batteries, but hindered by a memory effect and environmental concerns due to cadmium.

Can nickel cadmium batteries be used at high discharge rates?

Although the battery discharge rate and battery temperature are an important variable for chemical batteries, these parameters have little effect in nickel-cadmium batteries compared to lead-acid batteries. Therefore nickel-cadmium batteries can be used at high discharge rates without losing their nominal capacity.

How are Ni-Cd batteries recycled?

Recycling Ni-Cd batteries is a complex process that involves separating the nickel, cobalt and cadmium from the electrodes, a process perfected by Saft's plant in Oskarshamn, Sweden - the only one worldwide involved in both the recycling and manufacturing of Ni-Cd batteries and incorporating recycled metals.

Are nickel cadmium batteries better than lead acid batteries?

Since Nickel-cadmium (NiCd) batteries have a higher energy density (50-75 Wh/kg) and have a better life (2000-2500 cycles), directly compete with lead acid batteries. They are suitable for uninterruptible power supply and generator start applications .
