

## Overview

What are the parameters of a PV inverter?

Aside from the operating voltage range, another main parameter is the start-up voltage. It is the lowest acceptable voltage that is needed for the inverter to kick on. Each inverter has a minimum input voltage value that cannot trigger the inverter to operate if the PV voltage is lower than what is listed in the specification sheet.

What voltage should an inverter output be?

The inverter output voltage should comply to the standard voltage level and has to be within 228V to 252 V. For U.S, the accepted voltage level is 110V. The inverter output voltage needs to be within 98 V to 122V. The output voltage should be in the range as mentioned above in order for it to be grid or appliance compatible.

Why do solar inverters need a voltage range?

This range is critical for the inverter to efficiently convert the DC electricity from the photovoltaic (PV) array into usable AC power. The input voltage is a dynamic parameter that varies based on factors such as the type of inverter, its design, and the specific requirements of the solar power system.

What parameters should be considered when stringing an inverter and PV array?

Both the maximum voltage value and operating voltage range of an inverter are two main parameters that should be taken into account when stringing the inverter and PV array. PV designers should choose the PV array maximum voltage in order not to exceed the maximum input voltage of the inverter.
