# Power station energy storage container spacing

## Overview

What are the ESS requirements for reservoir power plants?

Basically, ESS applications in large RES power plants require relatively large ESS capacity. The discharge duration requirements of reservoir vary from minutes to an hour with different types of market, while the requirements for energy shifting and seasonal energy storage are relatively longer.

How much energy can a ESS unit store?

Individual ESS units shall have a maximum stored energy of 20 kWh per NFPA Section 15.7. NFPA 855 clearly tells us each unit can be up to 20 kWh, but how much overall storage can you put in your installation?

That depends on where you put it and is defined in Section 15.7.1 of NFPA 855.

What does NFPA 855 mean for energy storage systems?

Specifically, we're focused on spacing requirements and limitations for energy storage systems (ESS). NFPA 855 sets the rules in residential settings for each energy storage unit—how many kWh you can have per unit and the spacing requirements between those units. First, let's start with the language, and then we'll explain what this means.

Why should ESS be installed in Res power plants?

ESS can be installed in RES power plants to provide reservoir for smoothing intermitted power outputs and reduce wind/solar power curtailment. Besides, ESS can also help generation side to acquire arbitrage in electricity market via seasonal energy storage and time shift energy .
