Power stations use generators to generate electricity

Overview

What is the difference between a power station and a generator?

The terms power station and generator are often used interchangeably, but they refer to distinct components within the electrical power supply system. Understanding the differences between a power station and a generator is crucial for industries, engineers, and consumers relying on consistent electricity.

How does a power station turn a generator?

Power Stations Turning a generator produces electricity. To turn the generators we connect them to turbines. We use different energy resources to turn the turbines. Wind and water flow can turn turbines directly. Steam is often used, produced by heating water. The heating is done by burning fuels, or using other heat sources.

How do power stations generate electricity?

Understanding how power stations generate electricity requires examining different plant types: These plants burn coal, oil, or natural gas to heat water, creating steam that spins turbines. Despite environmental concerns, fossil fuel stations still supply a large portion of the world's electricity.

What is a power generating station?

A power generating station (also called a power plant or power station) is an industrial facility that converts primary energy —such as chemical energy in fuels, nuclear energy, or kinetic/thermal energy from nature—into electrical energy. The output is synchronized with the grid, stepped up in voltage, and transmitted to consumers.
