# Set the inverter output voltage high

## Overview

---

What are inverter settings?

Inverter Settings 1. To set output voltage of inverter - This is normally 230 Vac. Possible values 210V ~ 245V. 2. Used to enable/disable the internal ground relay functionality. Connection between N and PE during inverter operation. - The ground relay is useful when an earth-leakage circuit-breaker is part of the installation.

What is the proposed inverter voltage correction circuit?

The proposed inverter voltage correction circuit can be understood with the help of the following points: A single opamp performs the function of a comparator and a voltage level detector. The high voltage AC from the transformer output is stepped down using a potential divider network to about 14V.

How does an inverter work?

The idea is simple, as soon as the output voltage crosses a predetermined danger threshold, a corresponding circuit is triggered which in turn switches OFF the inverter power devices in a consistent manner thereby resulting a controlled output voltage within that particular threshold.

How to configure a solar inverter?

We provide a list for you to know how to correctly configure the solar inverter: The very first step is to choose a location where your panels can receive the maximum sunlight. Your panels must not be under any shades, and there must not be any obstruction between the solar panel and the sunlight.
