# Solar inverter ratio

## Overview

---

DC/AC ratio, also called inverter loading ratio (ILR), is the array's STC power divided by the inverter's AC nameplate power.  $ILR = P_{DC, STC} / P_{AC, rated}$ . What is a good DC/AC ratio for a solar inverter?

If a PV array has a rated DC capacity of 12kW and the inverter has an AC rated output of 10kW, the DC/AC ratio would be 1.2. What Is the Ideal DC/AC Ratio?

In most cases, the ideal DC/AC ratio typically ranges between 1.2 and 1.4. However, the optimal value can vary based on local climate conditions, equipment costs, and specific project goals.

What is solar inverter sizing?

Proper solar inverter sizing is a nuanced process that balances system power, losses, safety margins, and regulatory compliance. Utilizing calculators and adhering to standards ensures optimal system performance and longevity. Calculate the perfect solar inverter size for your system power with our easy-to-use Solar Inverter Sizing Calculator.

What makes a good solar inverter?

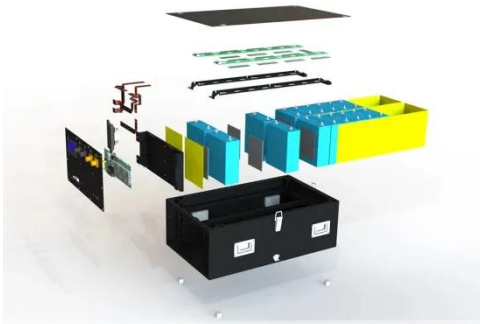

DC/AC ratio and inverter loading shape real solar yield more than most design choices. Set them well and you gain energy all year, keep the inverter in its high-efficiency zone, and leave headroom for grid support and batteries. This piece focuses on practical math, climate effects, and sizing ranges you can use today.

What happens if a solar inverter has a high DC to AC ratio?

The Clipping Trade-Off: The one downside of a high DC to AC ratio is a phenomenon called "clipping." This occurs on bright, sunny days when the solar panels produce more DC power than the inverter's maximum AC output. The inverter "clips" the excess power, meaning that energy is lost.
