Why do solar panels produce direct current (DC) electricity?

This blog post explores why solar panels produce direct current (DC) electricity, delving into the science behind solar panel electricity generation, the photovoltaic effect, and the role of inverters in converting DC to AC electricity for household use. Solar panels generate electricity through the photovoltaic effect.

How do solar panels work?

Solar panels work by converting sunlight into electricity through a process called the photovoltaic effect. This process produces direct current (DC) electricity, which then needs to be converted to alternating current (AC) electricity for your home to use.

What is the photovoltaic effect?

The photovoltaic effect is a process that generates voltage or electric current in a photovoltaic cell when it is exposed to sunlight. It is this effect that makes solar panels useful, as it is how the cells within the panel convert sunlight to electrical energy. The photovoltaic effect was first discovered in 1839 by Edmond Becquerel.

What happens when sunlight hits a solar panel?

When sunlight hits the solar cells within the panel, it excites electrons, causing them to move and create an electric current. This process is fundamental to converting sunlight into usable electrical energy. The photovoltaic effect occurs when photons from sunlight strike a semiconductor material, usually silicon, within the solar cell.
