## Overview

What are thin-film photovoltaic (PV) modules?

Thin-film photovoltaic (PV) modules are among the main alternatives to silicon modules in commercial solar energy systems. Thin-film technologies account for a small but growing share of the global solar market and are expected to grow at a compound annual growth rate of 23% from 2020-2025.

What materials are used for thin-film solar technology?

The most commonly used ones for thin-film solar technology are cadmium telluride (CdTe), copper indium gallium selenide (CIGS), amorphous silicon (a-Si), and gallium arsenide (GaAs). The efficiency, weight, and other aspects may vary between materials, but the generation process is the same.

What is thin-film solar technology?

Thin-film solar technology represents a departure from traditional silicon-based solar panels. Instead of using thick layers of crystalline silicon, thin-film solar cells are made by depositing one or more thin layers of photovoltaic material onto a substrate.

Are thin-film solar modules the future of photovoltaic technology?

Thin-film solar modules are rapidly advancing in photovoltaic technology, with significant improvements in efficiency, flexibility, and application across various sectors. Ongoing efforts to boost durability and scalability are overcoming past challenges, encouraging broader adoption.
