Thin-film solar module equipment

Overview

What is thin-film solar technology?

In thin-film solar technology, a large glass panel forms the base material, on which a relatively thin layer of 1 to 2 μm of photoactive compound is applied. Amongst others, alloys consisting of copper, indium, gallium and selenium or sulfur (CIGS), compounds of cadmium and tellurium (CdTe) or thin silicon layers are used in this process.

Who makes thin film solar panels?

Hanergy Thin Film Power Group, based in China, is a leading innovator in flexible thin film solar panels. The company specializes in copper indium gallium selenide (CIGS) thin film technology, which offers superior flexibility and adaptability compared to traditional rigid solar panels.

Can thin films be used in solar technology?

The concept of utilizing thin films in solar technology dates back several decades, with researchers initially focusing on alternative materials and fabrication techniques to overcome the limitations of conventional crystalline silicon solar cells.

What is a thin film solar cell?

Around 90 percent of the photovoltaic systems installed worldwide operate with solar cells made of crystalline silicon. Thin film modules have numerous advantages: They are lighter, cope with shade better and deliver high yields in weak light conditions.

 Amorphous silicon is the absorber layer in the solar panels. The amount of silicon used in PowerFilm solar panels is as low as 1 percent of the amount used in traditional solar panels. PowerFilm has a strong environmental profile and is cadmium free. Single and tandem junction devices are manufactured. Finished panels are encapsulated in materials See more on [powerfilmsolar CIGS Thin-Film Photovoltaics](#)
