# **Three grounding of solar container communication station energy management system**

## Overview

---

What is a grounding conductor (EGC) in a solar inverter?

The equipment grounding conductor (EGC) from the main panel and PV arrays are connected to the Ground terminal and Ground bus in the inverter. Both grounding electrode conductors (GEC) are connected to the individual grounding rod used for both systems.

Do PV systems need grounding?

It is a mandatory practice required by NEC and IEC codes to protect both equipment and personnel from damage and electric shock hazards. This article covers grounding in PV systems, which differs slightly from standard grounding systems.

How a solar panel is connected to a ground bus?

As shown, the PV arrays is connected to the ground bus in inverter via EGC. The AC EGC is connected from the main panel to the inverter ground terminal. The frames of PV/solar panels can be connected to the DC ground busbar. This is because, in most cases, the ground rods for both AC and DC are bonded together through the inverter.

Which grounding rods are used in a solar inverter?

As shown in the fig, separate grounding rods are used for individual systems e.g. AC side and DC side. The equipment grounding conductor (EGC) from the main panel and PV arrays are connected to the Ground terminal and Ground bus in the inverter.
