How do flow batteries work?

Flow batteries are electrochemical cells, in which the reacting substances are stored in electrolyte solutions external to the battery cell. Electrolytes are pumped through the cells. Electrolytes flow across the electrodes. Reactions occur at the electrodes. Electrodes do not undergo a physical change. Source: EPRI K. Webb ESE 471 4 Flow Batteries.

What are the components of a flow battery?

Flow batteries comprise two components: Electrochemical cell. Conversion between chemical and electrical energy. External electrolyte storage tanks. Energy storage. Source: EPRI K. Webb ESE 471 5 Flow Battery Electrochemical Cell. Electrochemical cell. Two half-cells separated by a proton-exchange membrane (PEM).

Why are electrolytes used in flow batteries?

In flow batteries, electrolytes are used as part of the heat management strategy. This helps reduce the need for complex heating or cooling of the battery system, making it more cost-effective. Additionally, since electrochemical cells share a common electrolyte, each cell can be in the same state of charge, simplifying cell balancing and battery operation.

How does a flow battery differ from a conventional battery?

In contrast with conventional batteries, flow batteries store energy in the electrolyte solutions. Therefore, the power and energy ratings are independent, the storage capacity being determined by the quantity of electrolyte used and the power rating determined by the active area of the cell stack.
