What does two charging and two discharging of energy storage equipment mean

Overview

The core business logic of the "two-charge, two-discharge" strategy is very simple, similar to an "energy transporter": charge the energy storage system during periods of low electricity prices and discharge it to businesses during periods of high electricity prices, earning profits by profiting from the price difference. Do industrial and commercial users need distributed energy storage?

However, industrial and commercial users consume a large amount of electricity and have high requirements for energy quality; therefore, it is necessary to configure distributed energy storage. Based on this, a planning model of industrial and commercial user-side energy storage considering uncertainty and multi-market joint operation is proposed.

What is energy storage?

Energy storage, as a "buffer" between the uncertainty of power generation and the disorder of load use in the Energy Internet, is its key supporting technology. Unlike the large-scale centralized energy storage on the power supply side and the grid side, distributed energy storage is usually installed on the user side or in the microgrid.

How to plan the energy storage system on the user side?

For the planning of the energy storage system on the user side, the main problems are: Li D et al. [9] consider the annual comprehensive cost of installing the energy storage system and the daily electricity charge of users and establish a two-level optimization model.

Should industrial and commercial users arrange energy storage?

Industrial and commercial users consume large amounts of electricity and have high requirements for a stable power supply. Therefore, it is necessary to encourage industrial and commercial users to arrange energy storage, and how to make reasonable planning is the main problem.
