What is the discharge current of the base station battery

Overview

How long can a battery be discharged?

Maximum 30-sec Discharge Pulse Current -The maximum current at which the battery can be discharged for pulses of up to 30 seconds. This limit is usually defined by the battery manufacturer in order to prevent excessive discharge rates that would damage the battery or reduce its capacity.

What does discharge rate mean on a battery?

The discharge rate indicates how quickly a battery can safely deliver energy. Like the charge rate, it's expressed as a multiple of the battery's capacity. 1C Discharge Rate: Discharging a 2000mAh battery at 2000mA. 2C Discharge Rate: Discharging the same battery at 4000mA.

What percentage of a battery should be discharged?

Shallow Discharge: Using only 20-30% of the battery's capacity. Deep Discharge: Using 80-100% of the battery's capacity. Deeper discharges can shorten the battery's lifespan. For example, a battery cycled at 80% DoD may last only 500 cycles, while the same battery cycled at 20% DoD could last 2000 cycles.

How to calculate battery discharge power to empty state?

Typically maximum continuous battery discharge power to empty state is given by (24) $P_{Bat, cont, D, max, empty} = I_{Bat, D, finish} V_{Bat, EOD}$ wherein $I_{Bat, D, finish}$ is the finishing discharge current and $V_{Bat, EOD}$ is the battery end-of-discharge voltage of the cell or battery as declared by the manufacturer ($V_{Bat, EOD} > 0$).

What is the discharge current of the base station battery

Battery discharge current

The discharge current may alternatively be expressed as a multiple of the rated discharge current. For example, if the battery is specified at the 10 hour rate, $I_{10} = C/10 \dots$
