Wind power plant frequency regulation and energy storage

Overview

Why is wind energy wasted during the frequency regulation process?

Results from [7] show that some wind energy is wasted during the frequency regulation process because the wind turbine can only use the energy stored in the rotor. Energy storage systems are applied to wind farms to help maintain the frequency stability of the system after wind power is connected to the power system.

Does wind energy affect power system frequency regulation?

It has been indicated by recent investigations that large penetration of wind energy has an impact on modern power system frequency regulation along with AGC systems and other control operation issues .

What is a power system with wind power and energy storage?

Power system with wind power and energy storage. The frequency regulation model containing wind power and energy storage can be divided into primary frequency regulation, secondary frequency regulation, wind power regulation, and battery regulation. When a disturbance occurs, these regulation methods can be regulated individually or in combination.

Can wind power and energy storage improve frequency regulation?

The participation of wind power and energy storage in frequency regulation can significantly improve the amplitude-frequency response gain of the power system. Wind power and energy storage can significantly suppress the disturbance gain in the frequency band below the fundamental frequency.
